

TRAC360 Anti-Theft Tips

Fit additional security measures, track and wheel clamps can be easily fitted making it difficult for the machine to be moved.

Add additional isolator switches: It doesn't have to be a bespoke isolator switch, a simple on / off switch can be wired in to the fuel stop solenoid wiring stopping the engine from starting.

Immobilisation: Off the shelf immobilisers make it difficult for thieves to start the machine without the RFID tag, but this can cause issues for multiple drivers if they haven't got the RFID tag! BUT if you use a latching relay setup you can have multiple circuits immobilised: Fuel, hydraulics, and main ignition feed.

Keys: A lot of older machinery use the same key, its common knowledge on a number of manufacturers machines the same key will fit. Change the ignition switch barrel so the key you use to open the door can't be used to start the engine.

Postcode: For machinery with cabs have your postcode painted on the roof making them easily identified from the air.
